
*Cell text: geometric mean error ratio, then subjects with lower error out of 10. * Holm adjusted p < 0.05, only for the primary family, which was chosen after an initial look at the data (the four fixed codes at p = 0.05 under bit flip and phase flip noise); all other cells are exploratory.*
Colors saturate beyond 1/16 and 16. Per subject values are means over matched seeds (seed counts under each column).
